

Seedling to Success:

Sustaining Timber Production in the
HPF Management Zone of the Triad Model

2025 CWF FALL MEETING

October 8 - 9, 2025
Inn on Prince,
Truro, NS

In association with

Seedling to Success:

Sustaining Timber Production in the HPF Management Zone of the Triad Model

The High Production Forestry (HPF) management zone is one of three distinct management zones within the Triad model of ecological forestry adopted in Nova Scotia. It is designed to support the long-term, sustainable production of timber forest products. This is achieved by implementing intensive, state-of-the-art silvicultural practices aimed at maximizing timber yields while maintaining ecological integrity. By concentrating timber production in designated areas, the HPF zone helps balance economic, ecological, and conservation objectives across the broader forested landscape.

Over the course of this two-day conference, our focus will be on building meaningful connections and sharing practical knowledge to enhance our collective understanding of key operational aspects of High Production Forestry (HPF). Through a mix of formal presentations and in-field demonstrations, we'll examine leading-edge practices that drive successful HPF implementation. Topics will range from site selection and intensive silviculture planning to the importance of treatment timing, operational specifications for successful plantation establishment, and effective stand tending—all critical elements for delivering sustainable, high-yield forestry.
